

## Case – Front end developer

---

### Assignment

---

You have become responsible for taking a graphical concept from an art director, and developing it into a working prototype that can be presented to an agency.

Using the PSD provided, build a responsive HTML prototype that shows how this page could work on desktop/tablet/mobile

The key points we are looking for are:

1. Your ability to create a responsive site
2. Your ability to have design input (there is no design for a mobile site)
3. Good, clean code
4. Modern techniques for improving interaction and user experience.

If possible, please also include a brief description of your workflow and how you came to the decisions you made during the process. Time may not allow you to create an entirely functional page so please also document what has and has not been completed, and what you would do if you had more time.

We expect you to spend approx 8 hours on the project.

If you have any questions about the brief, please do not hesitate to contact Valtech.

Enjoy!
